Sedentary Behavior, Eating Habits, and Their Association with Fast Food Consumption: A Cross-Sectional Study Among Bangladeshi University Students by Residential Status

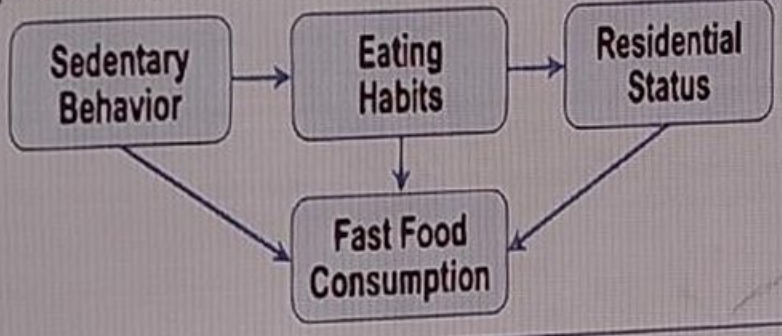

Mohammad Omar Nurshad, Department of Statistics, University of Chittagong, Bangladesh |
Session: 2019–2020 | Email: [redacted]

Participant ID: **PLHS13**

PLHS13

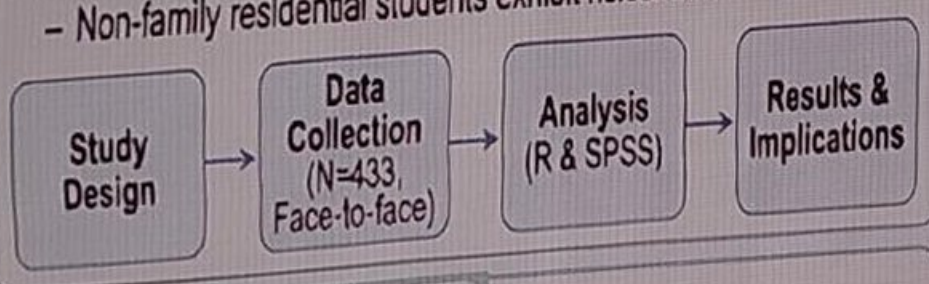

Introduction and Background

- Rising **fast food consumption** in Bangladesh.
- **Health risks**: obesity, diabetes, CVD, mental health.
- Role of **sedentary behavior & eating habits**.
- **Research gap** in South Asian university settings.
- Importance of **residential status**.

Study Objectives & Hypotheses

- Examine association between sedentary behavior and fast food intake.
- Explore eating habits linked to frequent fast food consumption.
- Assess differences by residential status.
- **Hypotheses:**
  - Higher sedentary behavior → higher fast food consumption.
  - Poor eating habits → higher fast food intake.
  - Non-family residential students exhibit riskier behaviors.

METHODOLOGY

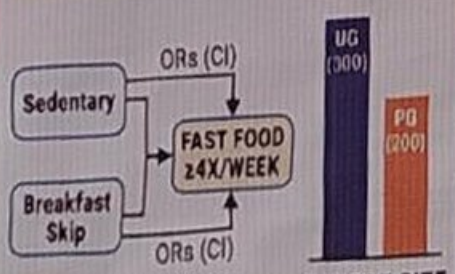

- Cross-sectional survey
- University of Chittagong
- n=400-500 students (UG/PG)

QUESTIONNAIRE HIGHLIGHTS

- **Demographics:** Age, Gender, Income
- **Eating:** Breakfast skip? Fruit/veg freq?
- **Outcome:** Fast food ≥4x/week

STATISTICS

- Logistic Regression (R/SPSS v28)
- Adjusted Odds Ratios + 95% CI
- Composite Lifestyle Indices
- Residential Subgroup Analysis

Results / Key Findings

- 433 Participants. High sedentary behavior & irregular eating common.
- Positive association: Sedentary Behavior & Fast Food Intake ($p < 0.001$).
- Residential status moderates: Dormitory/Off-campus students at higher risk.
- Ordinal Logistic Regression: Model significant, McFadden pseudo $R^2 = 0.129$.

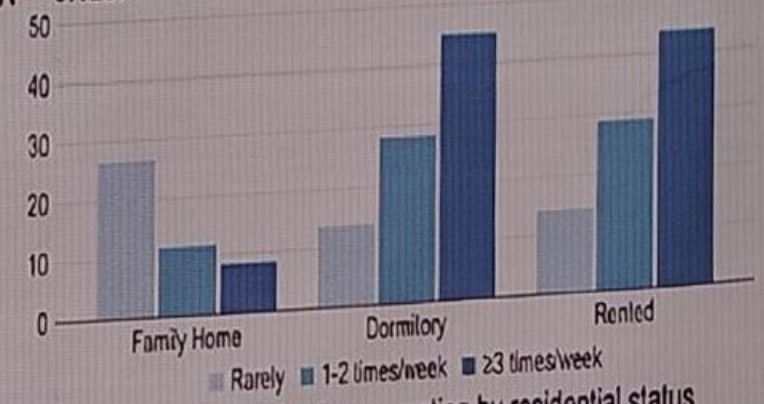

Figure 2. Fast-food consumption by residential status

Further Results

- **Figure 4:** Unhealthy habits (skipping breakfast, frequent snacking) linked to higher intake.

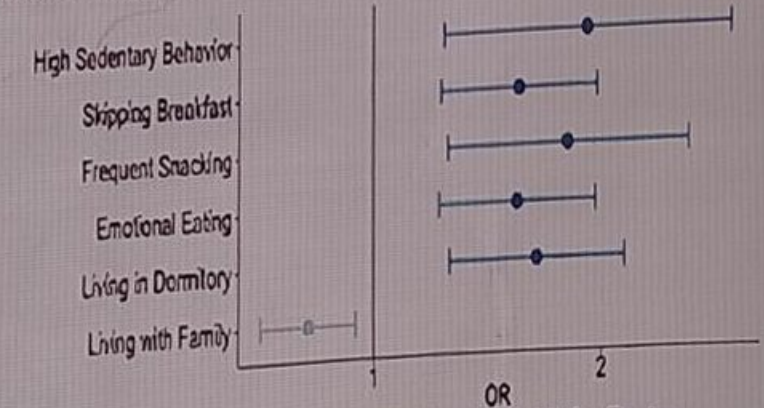

Figure 6. Adjusted Odds Ratios (95% CI) for Factors

Discussion & Conclusion

- **Lifestyle clustering**: Screen exposure reinforces unhealthy food choices.
- Students away from family show higher vulnerability.
- **Emotional eating** influences dietary choices.
- **Conclusion**: Sedentary behavior and eating habits jointly influence fast food intake. Residence-specific interventions needed.
- **Future Directions**: Longitudinal studies to evaluate causal pathways and intervention effectiveness.
- **Ethics**: Informed consent, approval, confidentiality ensured.
